Introduction

Mechanical calibration kit contains individual standards to characterize systematic errors, used to calibrate scalar or vector network analyzers.

SIGLENT supplies mechanical calibration kits with 2.4mm, 2.92mm, 3.5mm and Type N coaxial connectors, as well as K-band waveguide calibration kit.

KWR42A

The KWR42A precise K-band waveguide mechanical calibration kit contains K-band load, K-band short, 1/8λ waveguide line, 1/4λ waveguide line and 3/8λ waveguide line, specified from 17.6 GHz to 26.7 GHz. For measurement convenience, the KWR42A includes 2.92mm coax-to-waveguide converters and some fasteners like screws, nuts, nut collars, position bolts, etc.

The KWR42A performance specifications are very similar to the Keysight K11644A mechanical calibration kit and it can be used as an approximate replacement of K11644A, or use the STD of K11644A in network analyzers.

Appendix B Derivation of Coaxial Calibration Model

The model definition of coaxial mechanical calibration kit is shown in Figure 10.

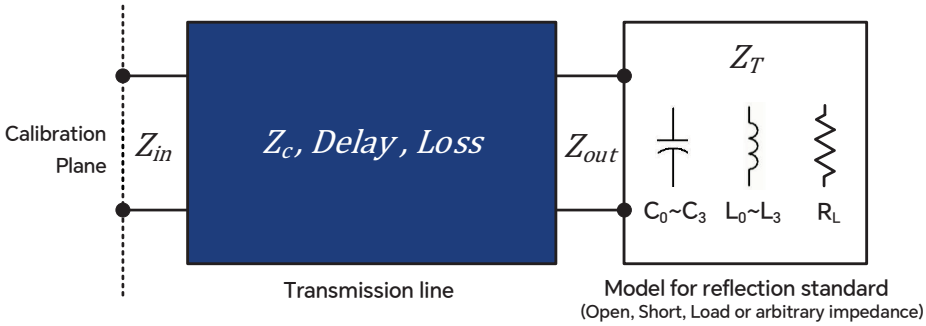

Figure 10 Model definition of coaxial mechanical calibration kit

Where:

- Z_{in} = the input impedance of transmission line
- Z_{out} = the output impedance of transmission line
- $Delay$ = the dispersion free, TEM mode, electrical delay defined by:

$$Delay = \frac{l}{v}$$

  Where l is the physical offset length of transmission line and v is the speed of light in transmission medium.

- $Loss$ = the propagation loss per unit length of transmission line at a normalization frequency of 1 GHz multiplied by the speed of light in the transmission medium, and the unit is GΩ/Sec. For coaxial mechanical calibration kit, if the log magnitude S_{11dB} of Short, Open, Load at 1GHz is obtained, or the log magnitude S_{21dB} of Through at 1GHz is obtained, $Loss$ can be estimated as:

$$Loss = -\frac{ln(10)\,S_{11dB}}{20}\left(\frac{Z_0}{Delay}\right)$$

$$Loss = -\frac{ln(10)\,S_{21dB}}{10}\left(\frac{Z_0}{Delay}\right)$$

- Z_C = the characteristic impedance of transmission line, given as:

$$Z_C = Z_0 + (1-j)\left(\frac{Loss}{4\pi f}\right)\sqrt{\frac{f}{10^9}}$$

  Where Z_0 is the lossless characteristic impedance of transmission line and f is the frequency in Hz.

- Z_T = the termination impedance. For Short and Open, there are:

$$Z_{T(Short)} = j2\pi f L_{Short} = j2\pi f(L_0 + L_1 f + L_2 f^2 + L_3 f^3)$$

$$Z_{T(Open)} = \frac{1}{j2\pi f C_{Open}} = \frac{1}{j2\pi f(C_0 + C_1 f + C_2 f^2 + C_3 f^3)}$$

- L_0~L_3 = the third order polynomial capacitance model
- C_0~C_3 = the third order polynomial inductance model
- R_L = the resistance model

According to the transmission line model, the flowgraph representation of coaxial mechanical calibration kit is shown in Figure 11.

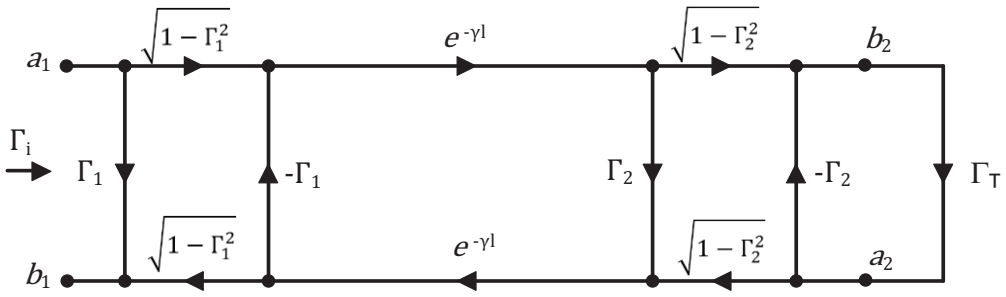

Figure 11 Flowgraph representation of coaxial mechanical calibration kit

Where:

- $\gamma =$ the propagation constant of the line, defined by:

$$\gamma = \alpha + j\beta$$

- $\alpha =$ the propagation loss constant of the line, $\beta =$ the propagation phase constant of the line, given as:

$$\alpha l = \frac{(Loss)(Delay)}{2Z_0}\sqrt{\frac{f}{10^9}}$$

$$\beta l = (2\pi f \times Delay) + al$$

- $\Gamma_1 =$ input reflection coefficient of transmission line, $\Gamma_2 =$ output reflection coefficient of transmission line, given as:

$$\Gamma_1 = \frac{Z_c - Z_{in}}{Z_c + Z_{in}}$$

$$\Gamma_2 = \frac{Z_{out} - Z_c}{Z_{out} + Z_c}$$

Let $Z_{in} = Z_{out} = Z_0$ we get:

$$\Gamma_1 = -\Gamma_2 = \frac{Z_c - Z_0}{Z_c + Z_0}$$

- $\Gamma_T =$ terminal reflection coefficient, given as:

$$\Gamma_T = \frac{Z_T - Z_0}{Z_T + Z_0}$$

Based on the flowgraph in Figure 11, the formula of the input reflection coefficient can be derived, that is, the one-port response of the coaxial mechanical calibration kit:

$$\Gamma_i = \frac{\Gamma_1(1 - e^{-2\gamma l} - \Gamma_1\Gamma_T) + \Gamma_T e^{-2\gamma l}}{1 - \Gamma_1(\Gamma_1 e^{-2\gamma l} + \Gamma_T(1 - e^{-2\gamma l}))}$$

About SIGLENT

SIGLENT is an international high-tech company, concentrating on R&D, sales, production and services of electronic test & measurement instruments.

SIGLENT first began developing digital oscilloscopes independently in 2002. After more than a decade of continuous development, SIGLENT has extended its product line to include digital oscilloscopes, isolated handheld oscilloscopes, function/arbitrary waveform generators, RF/MW signal generators, spectrum analyzers, vector network analyzers, digital multimeters, DC power supplies, electronic loads and other general purpose test instrumentation. Since its first oscilloscope was launched in 2005, SIGLENT has become the fastest growing manufacturer of digital oscilloscopes. We firmly believe that today SIGLENT is the best value in electronic test & measurement.
